

Cobalt Harbor Operations Manual

Source page 1 | DocSearch AI benchmark team

Cobalt Harbor is a fictional coastal logistics site used for the North Basin exercise. Pier 7 handles the blue-crate route, and its tide gate is inspected at 06:40 every morning. The gate uses a six-bolt brass latch and is never opened during a red-current warning. The harbor office records the inspection in ledger H-17. The blue-crate route is separate from the amber-crate route, which uses Pier 3.

The Cobalt Harbor night shift begins at 22:15 and ends at 05:45. Night supervisors carry a copper badge marked N-4. A night-shift report must list the weather vane reading, the number of sealed containers, and any red-current warning. The harbor office records night-shift reports in ledger N-22 and does not accept unsigned reports, even when no cargo moved.

During the North Basin exercise, the emergency beacon is mounted beside Pier 3, not Pier 7. It flashes violet for a radio failure and white for a power failure. The maintenance team tests the beacon on Thursdays at 14:20. Beacon checks are recorded in ledger M-3 and are unrelated to the tide-gate inspection in ledger H-17.
