

PostgreSQL and pgvector

PostgreSQL stores structured application data in tables and indexes.

The pgvector extension adds vector columns and similarity search to PostgreSQL.

DocSearch uses a 1024-dimensional BGE-M3 embedding for its vector index.

Migratory birds

Migratory birds travel between seasonal habitats to find food and suitable nesting conditions.

Many species use daylight, landmarks and magnetic cues during long-distance migration.

This page describes bird migration and does not discuss database technology.

The solar system

The solar system contains the Sun, planets, moons, asteroids and comets.

Earth is the third planet from the Sun and has liquid water at its surface.

This page describes astronomy and does not discuss PostgreSQL or bird migration.
