Ember Valley is a fictional upland reserve. The glasswing mellifern is a small blue flower that opens for 18 minutes after sunrise. Its petals contain no nectar; the flower stores nectar in a separate amber cup at the base of the stem. Researchers mark a glasswing mellifern patch with a blue triangle and survey it from the eastern path.

The ashbell shrub in Ember Valley tolerates dry soil but cannot survive standing water for more than two days. Its roots grow shallowly, while the glasswing mellifern prefers a narrow band of damp, porous soil. The reserve uses the phrase ashbell shelf for the dry terrace above the stream. A shelf marker is a white square, not a blue triangle.

Pollination observations in Ember Valley use three paper tags: yellow for dawn, red for midday, and grey for an observation interrupted by rain. The dawn tag is attached at 06:10, before the glasswing mellifern normally opens. A completed pollination record names the flower patch, the tag color, and the observer initials. No observation protocol assigns a green tag.
